

TITLE: Magnetic Resonance Imaging for Pituitary Adenoma Detection in Patients with Hyperprolactinemia: Clinical Utility, Cost-Effectiveness, and Guidelines

DATE: 30 June 2016

RESEARCH QUESTIONS

1. What is the clinical utility of using magnetic resonance imaging (MRI) for tumour detection in patients presenting with hyperprolactinemia?
2. What is the cost-effectiveness of using MRI for tumour detection in patients presenting with hyperprolactinemia?
3. What are the evidence-based guidelines regarding appropriate indications and clinical criteria for conducting MRI screening on patients presenting with hyperprolactinemia?
4. What are the evidence-based guidelines regarding the clinical evaluation and diagnostic assessment of patients presenting with hyperprolactinemia?

KEY FINDINGS

One non-randomized study was identified regarding the clinical utility of using MRI for tumour detection in patients presenting with hyperprolactinemia. In addition, two evidence-based guidelines were identified relating to the appropriate clinical evaluation and diagnostic assessment of patients presenting with hyperprolactinemia.

METHODS

A limited literature search was conducted on key resources including PubMed, The Cochrane Library, University of York Centre for Reviews and Dissemination (CRD) databases, Canadian and major international health technology agencies, as well as a focused Internet search. For research questions 1-3 no methodological filters were used to limit results by study type. For research question 4 methodological filters were applied to limit retrieval to health technology assessments, systematic reviews, meta-analyses and guidelines. Where possible, retrieval was

Disclaimer: The Rapid Response Service is an information service for those involved in planning and providing health care in Canada. Rapid responses are based on a limited literature search and are not comprehensive, systematic reviews. The intent is to provide a list of sources of the best evidence on the topic that the Canadian Agency for Drugs and Technologies in Health (CADTH) could identify using all reasonable efforts within the time allowed. Rapid responses should be considered along with other types of information and health care considerations. The information included in this response is not intended to replace professional medical advice, nor should it be construed as a recommendation for or against the use of a particular health technology. Readers are also cautioned that a lack of good quality evidence does not necessarily mean a lack of effectiveness particularly in the case of new and emerging health technologies, for which little information can be found, but which may in future prove to be effective. While CADTH has taken care in the preparation of the report to ensure that its contents are accurate, complete and up to date, CADTH does not make any guarantee to that effect. CADTH is not liable for any loss or damages resulting from use of the information in the report.

Links: This report may contain links to other information available on the websites of third parties on the Internet. CADTH does not have control over the content of such sites. Use of third party sites is governed by the owners' own terms and conditions.

limited to the human population. The search was also limited to English language documents published between January 1, 2011 and June 23, 2016. Internet links were provided, where available.

SELECTION CRITERIA

One reviewer screened citations and selected studies based on the inclusion criteria presented in Table 1.

Table 1: Selection Criteria	
Population	Adult patients with hyperprolactinemia
Intervention	Q1, 2 and 3: MRI Q4: Clinical evaluation and diagnostic approaches to detect pituitary adenomas
Comparator	Q1 and 2: No imaging; Alternative clinical evaluation or diagnostic procedures (including alternative diagnostic imaging modalities) Q3 and 4: No comparator
Outcomes	Q1: Rate of detection of pituitary adenomas, rate of provision of treatment Q2: Cost-effectiveness Q3 and 4: Evidence based guidelines regarding: <ul style="list-style-type: none"> • Appropriate clinical evaluation and diagnostic approaches following presentation with hyperprolactinemia • Appropriate indications and criteria (e.g., prolactin cut-off values) for the conduct of MRI screening in upon presentation with hyperprolactinemia
Study Designs	Health technology assessments, systematic reviews, meta-analyses, randomized controlled trials, non-randomized studies, economic evaluations, evidence-based guidelines

MRI = magnetic resonance imaging.

RESULTS

Rapid Response reports are organized so that the higher quality evidence is presented first. Therefore, health technology assessment reports, systematic reviews, and meta-analyses are presented first. These are followed by randomized controlled trials, non-randomized studies, economic evaluations, and evidence-based guidelines.

One non-randomized study was identified regarding the clinical utility of using MRI for tumour detection in patients with hyperprolactinemia. In addition, two evidence-based guidelines were identified relating to the appropriate clinical evaluation and diagnostic assessment of patients presenting with hyperprolactinemia. No relevant health technology assessments, systematic reviews, meta-analyses, randomized controlled trials, or economic evaluations were identified. In addition, there were no relevant evidence-based guidelines regarding appropriate indications and clinical criteria for conducting MRI screening on patients presenting with hyperprolactinemia.

Health Technology Assessments

No literature identified.

Systematic Reviews and Meta-analyses

No literature identified.

Randomized Controlled Trials

No literature identified.

Non-Randomized Studies
